

Chapter 6

Files and
Exceptions I

PEARSON

ALWAYS LEARNING

What is a file?

- a file is a collection of data that is stored on secondary storage like a disk or a thumb drive
- accessing a file means establishing a connection between the file and the program and moving data between the two

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Two Types of Files

files come in two general types:

- *text files* – files where control characters such as "`\n`" are translated
 - these files are generally human readable
- *binary files* – all the information is taken directly without translation
 - not readable and contains non-readable info

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

File Object or Stream

- when opening a file, you create a file object or file stream that is a connection between the file information on disk and the program
- the stream contains a buffer of the information from the file, and provides the information to the program

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

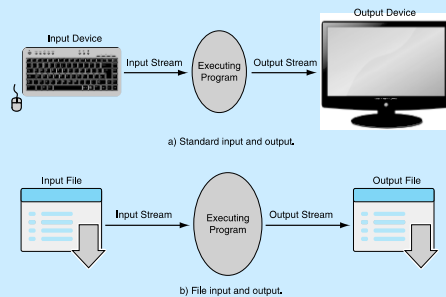

Figure 6.1 Input-output streams.

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Buffering

- reading from a disk is very slow
- thus the computer will read a lot of data from a file in the hopes that, if you need the data in the future, it will be buffered in the file object
 - this means that the file object contains a copy of information from the file called a cache (pronounced "cash")

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Making a File Object

```
my_file = open("my_file.txt", "r")
```

- **my_file** is the file object, which contains the buffer of information
- the open function creates the connection between the disk file and the file object
- the first quoted string is the file name on disk, the second is the mode to open it (here, "r" means to read)

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Where is the Disk File?

- when opened, the name of the file can come in one of two forms:
 - "file.txt" assumes the file name is file.txt and that it is located in the current program directory
 - "c:\bill\file.txt" is the fully qualified file name and includes the directory path

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Different Modes

Mode	How Opened	File Exists	File Does Not Exist
'r'	read-only	Opens that file	Error
'w'	write-only	Clears the file contents	Creates and opens a new file
'a'	write-only	File contents left intact and new data appended at file's end	Creates and opens a new file
'r+'	read and write	Reads and overwrites from the file's beginning	Error
'w+'	read and write	Clears the file contents	Creates and opens a new file
'a+'	read and write	File contents left intact and read and write at file's end	Creates and opens a new file

Table 6.1 File modes.

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Be Careful with Write Modes

- be careful if you open a file with the 'w' mode – it sets an existing file's contents to be empty, destroying any existing data
- the 'a' mode is nicer, allowing you to write to the end of an existing file without changing the existing contents

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Text Files Use Strings

- if you are interacting with text files (which is all we will do in this book), remember that *everything is a string*
 - everything read is a string
 - if you write to a file, you can only write a string

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Writing to a File

once you have created a file object, opened for reading, you can use the print command

- add **file=fileobject** to the print command

```
# open file for writing:
#   creates file if it does not exist
#   overwrites file if it exists
>>> temp_file = open("temp.txt", "w")
>>> print("first line", file=temp_file)
>>> print("second line", file=temp_file)
>>> temp_file.close()
```

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Closing the File

when the program is finished with a file, we must `close` it

- flush the buffer contents from the computer to the file
- tear down the connection to the file
- `close` is a method of a file obj
`file_obj.close()`
- all files should be closed!

Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Code Listing 6.1 Reverse file lines

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

```
input_file = open("input.txt", "r")
output_file = open("output.txt", "w")

for line_str in input_file:
    new_str = ''
    line_str = line_str.strip()      # get rid of carriage return
    for char in line_str:
        new_str = char + new_str    # concat at the left (reverse)
    print(new_str, file=output_file) # print to output_file

    # include a print to shell so we can observe progress
    print('Line: {:12s} reversed is: {}'.format(line_str, new_str))
input_file.close()
output_file.close()
```

"The Practice of Computing Using Python, 3rd Edition",

Word Puzzle

the following listings show how one might solve the following puzzle: look through a file of words, one word per line, and identify any word that has all the vowels in order, with only one example of each vowel

- for example, "facetious"

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Code Listing 6.3 clean_word

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

```
def clean_word(word):
    """Return word in lower case stripped of whitespace."""
    return word.strip().lower()
```

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Code Listing 6.4

```

data_file = open("dictionary.txt", "r")

def clean_word(word):
    """Return word in lower case stripped of whitespace."""
    return word.strip().lower()

# main program
for word in data_file:    # for each word in the file
    word = clean_word(word) # clean the word
    if len(word) <= 6:     # if word is too small, skip it
        continue
    print(word)

```

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Code Listing 6.6
Full Solution

```

# Find a word with a single example of the vowels a, e, i, o, u in that order
data_file = open("dictionary.txt", "r")

def clean_word(word):
    """Return word in lower case stripped of whitespace."""
    return word.strip().lower()

def get_vowels_in_word(word):
    """Return vowels in string word--include repeats."""
    vowel_str = "aeiou"
    vowels_in_word = ""
    for char in word:
        if char in vowel_str:
            vowels_in_word += char
    return vowels_in_word

# main program
print("Find words containing vowels 'aeiou' in that order:")
for word in data_file:    # for each word in the file
    word = clean_word(word) # clean the word
    if len(word) <= 6:     # if word is too small, skip it
        continue
    vowel_str = get_vowels_in_word(word) # get vowels in word
    if vowel_str == "aeiou": # check all vowels in order
        print(word)

```

Exceptions First Cut

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

How to Deal with Problems

- most modern languages provide methods to deal with 'exceptional' situations
- gives the programmer the option to keep the user from having the program stop without warning
- again, this is not about fundamental CS, but about doing a better job as a programmer

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

What Counts as Exceptional

- errors – indexing past the end of a list, trying to open a nonexistent file, fetching a nonexistent key from a dictionary, etc.
- events – search algorithm doesn't find a value (not really an error), mail message arrives, queue event occurs, mouse button is clicked

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Exceptions (2)

- ending conditions – file should be closed at the end of processing, list should be sorted after being filled
- weird stuff – for rare events, keep from clogging your code with lots of if statements

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Error Names

errors have specific names, and Python shows them to us all the time.

```
>>> input_file = open("no_such_file.txt", 'r')
Traceback (most recent call last):
  File "<pyshell#0>", line 1, in <module>
    input_file = open("no_such_file.txt", 'r')
IOError: [Errno 2] No such file or directory: 'no_such_file.txt'
>>> my_int = int('a string')
Traceback (most recent call last):
  File "<pyshell#1>", line 1, in <module>
    my_int = int('a string')
ValueError: invalid literal for int() with base 10: 'a string'
>>>
```

recreate an error to find the correct name; spelling counts!

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

A Kind of Non-local Control

basic idea:

- keep watch on a particular section of code
- if we get an exception, raise/throw that exception (let it be known)
- look for a catcher that can handle that kind of exception
- if found, handle it; otherwise let Python handle it (which usually halts the program)

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Doing Better with Input

- in general, we have assumed that the input we receive is correct (from a file, from the user)
 - this is almost never true
- there is always the chance that the input could be wrong
- our programs should be able to handle such errors

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Worse Yet, Input is Evil

- "Writing Secure Code," by Howard and LeBlanc
 - "All input is evil until proven otherwise"
- most security holes in programs are based on assumptions programmers make about input
- secure programs protect themselves from evil input

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

Rule 7

All input is evil, until proven otherwise

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

General Form, Version 1

```
try:
    suite
except a_particular_error:
    suite
```

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

try Suite

- the **try** suite contains code that we want to monitor for errors during its execution
- if an error occurs anywhere in that **try** suite, Python looks for a handler that can deal with the error
- if no special handler exists, Python handles it, meaning the program halts and with an error message as we have seen so many times ☹

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

except Suite

- an **except** suite (or perhaps multiple **except** suites) is associated with a **try** suite
- each exception names a type of exception it is monitoring for
- if the error that occurs in the **try** suite matches the type of exception, then that **except** suite is activated

"The Practice of Computing Using Python, 3rd Edition",
Punch & Enbody, Copyright © 2017 Pearson Education, Inc.

try/except Group

- if no exception in the **try** suite, skip all the **try/except** to the next line of code
- if an error occurs in a **try** suite, look for the right exception
- if found, run that **except** suite and then skip past the **try/except** group to the next line of code
- if no exception handling found, give the error to Python

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Code Listing 6.7 Find a line in a file

"The Practice of Computing Using Python, 3rd Edition",
Punch & Embury, Copyright © 2017 Pearson Education, Inc.

```
# read a particular line from a file. User provides both the line
# number and the file name

file_str = input( "Open what file:" )
find_line_str = input( "Which line (integer):" )

try:
    input_file = open(file_str)      # potential user error
    find_line_int = int(find_line_str) # potential user error
    line_count_int = 1
    for line_str in input_file:
        if line_count_int == find_line_int:
            print("Line {} of file {} is {}".format(find_line_int, file_str, \
            line_str))
            break
        line_count_int += 1
    else:
        # get here if line sought doesn't exist
        print("Line {} of file {} not found".format(find_line_int, file_str))
    input_file.close()

except FileNotFoundError:
    print("The file", file_str, "doesn't exist.")

except ValueError:
    print("Line", find_line_str, "Isn't a legal line number.")

print("End of the program")
```

Counting Poker Hands

Rank	Name	Description
9	Royal flush	Ace, king, queen, jack, ten + flush
8	Straight flush	Straight + flush
7	Four of a kind	Four equal ranks within five cards
6	Full house	Pair + different rank three of a kind
5	Flush	Five cards with the same suit
4	Straight	Five cards, sequentially ranked with no gaps
3	Three of a kind	Three equal ranks within five cards
2	Two pair	Two pairs of equal ranks within five cards
1	One pair	One pair of equal ranks within five cards
0	Nothing in hand	

A,10,1,7,2,12,4,2,2,1,9
A,9,4,12,4,13,5,6,3,4,9
3,2,2,3,12,3,1,4,2,3
4,10,2,8,13,8,7,1,7,1
4,8,3,8,1,3,1,4,3,7,1
2,7,2,3,10,4,13,5,7,1
1,4,5,4,5,5,4,10,2,10,2

C1-suit, C1-rank, C2-suit, C2-rank, C3-suit, C3-rank, C4-suit, C4-rank, C5-suit, C5-rank, hand Rank

Punch & Embury, Copyright © 2017 Pearson Education, Inc.

Reminder, rules so far

1. Think before you program!
2. A program is a human-readable essay on problem solving that executes on a computer.
3. The best way to improve your programming and problem solving skills is to practice!
4. A foolish consistency is the hobgoblin of little minds
5. Test your code, often and thoroughly
6. If it was hard to write, it is probably hard to read. Add a comment.
7. All input is evil, unless proven otherwise.
