

**Computer Science 304**  
**Computer Organization**  
**Spring 2025**  
**Assignment 8**

**Due: noon, Wednesday, 4/16/2025**

Answer the following questions and submit solutions by the due date. Show your work for full credit. All submissions must be completely your own work.

1. [16 points] Given the following memory, register, and immediate values, state the value of the operand.

| Address | Value | Register | Value |
|---------|-------|----------|-------|
| 0x200   | 0xAC  | %eax     | 0x200 |
| 0x204   | 0x2F  | %ecx     | 0x02  |
| 0x208   | 0x73  | %edx     | 0x03  |
| 0x20C   | 0x02  |          |       |

- %eax**
  - \$0x20C**
  - 0x20C**
  - (%eax)**
  - 8(%eax)**
  - (%eax,%edx,4)**
  - 4(%eax,%ecx,2)**
  - 0x1FC(%ecx,%edx,2)**
2. [10 points] For each of the following, state the equation that the instruction represents. The first result has been done for you. Provide all values in decimal.

| <b>Assume: %eax = x; %ecx = y; %edx = z;</b> |                  |
|----------------------------------------------|------------------|
| <b>INSTRUCTION</b>                           | <b>RESULT</b>    |
| <b>leal 6(%eax), %edx</b>                    | <b>z = 6 + x</b> |
| <b>leal 2(%ecx), %ecx</b>                    | (a)              |
| <b>leal (%ecx, %edx, 4), %eax</b>            | (b)              |
| <b>leal 11(%ecx, %ecx, 4), %edx</b>          | (c)              |
| <b>leal 0xCC(, %eax, 8), %ecx</b>            | (d)              |
| <b>leal 14(%eax, %edx, 4), %eax</b>          | (e)              |

3. [16 points] Consider the C function listed below.

```
void mystery (int a, int b) {
    int i, d, flag;

    while (a <= b) {

        for (i = 1; i <= a; ++i)

            if (!(a % i) && !(b % i))
                d = i;

        printf("%d %d: %d\n", a, b, d);

        ++a;
    }
}
```

- [3 points] Write a clear statement as to what this function actually does (not how it is implemented, but its purpose when called).
- [5 points] Rewrite the entire function with **a** and **b** passed by reference.
- [5 points] If we declared **int** variables **c** and **d** in the calling function, and initialized them to **10** and **50**, respectively, how would **mystery** be called using the modified code from (b)? What would be the values of **c** and **d** upon return? Is passing by reference a good idea for **a** or **b** to save space, avoid copying, or for permanently updating the arguments?
- [3 points] What, if any, restrictions or conditions need to be placed on the arguments passed to the **int** parameters **a** and **b**?

4. [8 points] Answer the following given the Y86 code on the right:

- [2 points] Assuming the value stored in **%eax** is 12, write a binary expression that represents the computation in line 6. What is the result?
- [4 points] Assuming that **%eax**, **%ebx**, **%ecx**, and **%edx** are represented by variables **a**, **b**, **c**, and **d**, respectively, write equivalent C code for lines 6-12.
- [2 points] What does this code do (not how it is implemented, but its purpose)?

|    |                 |               |               |               |
|----|-----------------|---------------|---------------|---------------|
| 1  | <b>irmovl</b>   | <b>\$1,</b>   | <b>%ecx</b>   | <b>#</b>      |
| 2  | <b>irmovl</b>   | <b>arr,</b>   | <b>%ebx</b>   | <b>#</b>      |
| 3  |                 |               |               |               |
| 4  | <b>loop:</b>    | <b>irmovl</b> | <b>\$3,</b>   | <b>%edx</b>   |
| 5  |                 | <b>rrmovl</b> | <b>%ecx,</b>  | <b>%eax</b>   |
| 6  |                 | <b>andl</b>   | <b>%edx,</b>  | <b>%eax</b>   |
| 7  |                 | <b>jne</b>    | <b>xxxx</b>   | <b>#</b>      |
| 8  |                 |               |               |               |
| 9  |                 | <b>rmmovl</b> | <b>%ecx,</b>  | <b>(%ebx)</b> |
| 10 |                 |               |               |               |
| 11 | <b>xxxx:</b>    | <b>irmovl</b> | <b>\$4,</b>   | <b>%eax</b>   |
| 12 |                 | <b>addl</b>   | <b>%eax,</b>  | <b>%ebx</b>   |
| 13 |                 |               |               |               |
| 14 |                 | <b>irmovl</b> | <b>\$1,</b>   | <b>%eax</b>   |
| 15 |                 | <b>addl</b>   | <b>%eax,</b>  | <b>%ecx</b>   |
| 16 |                 | <b>irmovl</b> | <b>\$100,</b> | <b>%eax</b>   |
| 17 |                 | <b>subl</b>   | <b>%ecx,</b>  | <b>%eax</b>   |
| 18 |                 | <b>jge</b>    | <b>loop</b>   |               |
| 19 |                 | <b>halt</b>   |               |               |
| 20 |                 |               |               |               |
| 21 | <b>.align 4</b> |               |               |               |
| 22 | <b>arr:</b>     |               |               |               |
