CSCI 454/554 Computer and Network Security

Topic 7.2 Public Key Infrastructure (PKI)

- œ
3000
SW/S
_ C

What Is PKI

WILLIAM & MARY

- Informally, the infrastructure supporting the use of public key cryptography.
- A PKI consists of
 - Certificate Authority (CA)
 - Certificates
 - A repository for retrieving certificates
 - A method of revoking certificates
 - A method of evaluating a chain of certificates from known public keys to the target name

Certification Authorities (CA) CAN CARY

• A CA is a trusted node that maintains the public keys for all nodes (Each node maintains its own private key)

If a new node is inserted in the network, only that new node and the CA need to be configured with the public key for that node

Certificates A CA is involved in authenticating users' public keys by generating certificates A certificate is a signed message vouching that a particular name goes with a particular public key

- Example:
 - . [Alice's public key is 876234]_{carol}
 - ^{2.} [Carol's public key is 676554]_{Ted} & [Alice's public key is 876234]_{carol}
- Knowing the CA's public key, users can verify the certificate and authenticate Alice's public key

.

Certificates

WILLIAM & MARY

- Certificates can hold expiration date and time
- Alice keeps the same certificate as long as she has the same public key and the certificate does not expire
- Alice can append the certificate to her messages so that others know for sure her public key

5

CA Advantages

WILLIAM & MARY

- 1. The CA does not need to be online. [Why?]
- If a CA crashes, then nodes that already have their certificates can still operate.
- 3. Certificates are not security sensitive (in terms of confidentiality).
 - Can a compromised CA decrypt a conversation between two parties?
 - Can a compromised CA fool Alice into accepting an incorrect public key for Bob, and then impersonate Bob to Alice?

CA Problems What if Alice is given a certificate with an expiration time and then is revoked (fired) from the system? Alice can still use her certificate till the expiration time expires. What kind of harm can this do? Alice can still exchange messages with Bob using her un-expired certificate. Solution: Maintain a Certificate Revocation List (CRL) at the CA. A Certificate is valid if (1) it has a valid CA signature,

Terminology

WILLIAM & MARY

A CA signing a certificate for Alice's public key

(2) has not expired, and (3) is not listed in the CA's CRL list.

- CA → issuer Alice → subject
- Alice wants to find the Bob's public key
 - Bob → target
- Anyone with a public key is a principal
- Alice is verifying a certificate (or a chain of certificates)
 - Alice → verifier
- Trust anchor → A CA with a trusted public key

0

PKI Models

WILLIAM & MARY

- Monopoly model
- 2. Monopoly + RA
- 3. Delegated CAs
- 4. Oligarchy model
- 5. Anarchy model
- 6. Name constraints
- 7. Top-down with name constraints
- 8. Bottom-up with name constraints

Monopoly Model	WILLIAM &MARY	
■ One CA universally trusted by e	veryone	
_		
 Everyone must get certificates f CA 	rom this	
<u>.</u> .		
■ The public key to this organizati		
only PKI trust anchor and is emb all software and hardware	eaded in	
	10	
	10	
Problems	WILLIAM &MARY	
	O WARI	-
 There is NO universally trusted organization 		
2. Monopoly control. CA could cha	rge any	
fees.		_
 Once deployed, it is hard to swi different CA 	tch to a	
4. Entire world's security relies on	this CA	
5. Inconvenient.		
	11	
🌋 PKI Models	WILLIAM &MARY	
Monopoly model		
2. Monopoly + RA		
3. Delegated CAs		
4. Oligarchy model5. Anarchy model		
6. Name constraints		
7. Top-down with name constrain		
 Bottom-up with name constrain 	its	

Monopoly+Registration Authorities (RA) MARY RAs are affiliated with the single CA and are trusted by this CA. RAs check identities and provide the CA with relevant information (identity and public key information) to generate certificates. More convenient (more places to be certified). Still a monopoly. All the monopoly problems still hold. WILLIAM & MARY PKI Models Monopoly model 2. Monopoly + RA 3. Delegated CAs 4. Oligarchy model 5. Anarchy model 6. Name constraints 7. Top-down with name constraints Bottom-up with name constraints

Delegated CAs
 The trust anchor (known CA) issues certificates to other CAs (delegated CAs) vouching for their trustworthiness as CAs.
 Users can obtain their certificates from delegated CAs instead of the trust anchor CA.
 Example:

 [Carol's public key is 676554]_{Ted} & [Alice's public key is 876234]_{carol}

• Ted: trust anchor CA & Carol: delegated CA

15

WILLIAM & MARY PKI Models 1. Monopoly model Monopoly + RA Delegated CAs 4. Oligarchy model 5. Anarchy model 6. Name constraints 7. Top-down with name constraints 8. Bottom-up with name constraints **© Oligarchy Model** WILLIAM &MARY A few trusted CAs and a certificate issued by any one of them is accepted Competition between CAs is good Problems: Not as secure as the monopoly case Need to protect more CAs (instead of only one) • Might be easier to trick a naïve user by inserting a bogus trust anchor in the list of trusted CAs It is hard to examine the set of trust anchors and determine whether some has modified the set **PKI Models** WILLIAM &MARY Monopoly model 2. Monopoly + RA 3. Delegated CAs 4. Oligarchy model 5. Anarchy model 6. Name constraints Top-down with name constraints Bottom-up with name constraints

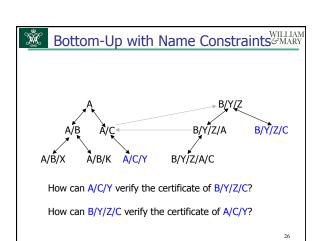

Anarchy Model (Web of Trust) WILLIAM MARY	
 Fully distributed approach. No CA or list of CA provided to the users. Anyone can sign certificates for anyone else. 	-
 Each user is responsible for configuring some 	
trust anchors (provide his own certificates for them).	
A database maintains these certificates.	
Unworkable on a large scale (Why?).	
19

PKI Models WILLIAM CHARY	
1. Monopoly model	
2. Monopoly + RA 3. Delegated CAs	
4. Oligarchy model	-
5. Anarchy model6. Name constraints	
7. Top-down with name constraints8. Bottom-up with name constraints	
8. Bottom-up with name constraints	
20	
Name Constraints WILLIAM WHARY	
A CA is responsible for certifying users in	
his domain only • WM CA certifies WM students	
• WIT CA CEITINES WIT STUDENTS	
 Provides complete autonomy 	
CAs need to be able to identify each other.	
How?	

WILLIAM どMARY PKI Models 1. Monopoly model Monopoly + RA Delegated CAs 4. Oligarchy model 5. Anarchy model 6. Name constraints 7. Top-down with name constraints 8. Bottom-up with name constraints Top-Down with Name Constraints WILLIAM TOP-DOWN WITH NAME CONSTRAINTS WILLIAM TO THE TOP TO THE TOT Everyone agrees on a root organization and the root CA delegates to other CA. (A centralized trust anchor (CA) + delegated CAs). To get a certificate, contact the root. You will be redirected to an appropriate delegated CA. Delegated CAs can only issue certificates for users in their domain. 23 **PKI Models** WILLIAM &MARY Monopoly model 2. Monopoly + RA 3. Delegated CAs 4. Oligarchy model 5. Anarchy model 6. Name constraints 7. Top-down with name constraints 8. Bottom-up with name constraints

Bottom-Up with Name Constraints WILLIAM BOTTOM BOTTOM WILLIAM BOTTOM BOT

- Assumes a hierarchical name space.
 - Similar to Internet domain names.
- Each organization maintains its own CA, and CAs link to others.
 - Similar to DNS tree hierarchy but also cross-links (cross certificates) are allowed (Forest hierarchy).
 - A parent certifies its children and children certify their parent.
- The hierarchy is traversed in a bottom-up fashion.
 - Follow up-links until you encounter an ancestor of the target, then follow at most one cross-link, and then follow down-links from there.

Advantages

WILLIAM & MARY

- 1. Easy to navigate the hierarchy (similar to DNS).
- 2. No monopoly.
- 3. Replacing keys is reasonably easy.
- 4. Can be deployed in any organization without help from the rest of the world.
- 5. Authentication between users in the same organization does not need to go outside the organization.

Certificate Revocation WILLIAM & MARY	
 Certificates for public keys (Campus IDs) might need to be revoked from the system Someone is fired Someone graduated Someone's certificate (card) is stolen 	
28	
*	
Certificate Revocation WILLIAM MARY	
 Certificates typically have an associated expiration time Typically in the order of months (too long to wait if it needs to be revoked) 	
 Solutions: Maintain a Certificate Revocation List (CRL) A CRL is issued periodically by the CA and contains all the revoked certificates 	
Each transaction is checked against the CRL	
29	
CRLs WILLIAM & MARY	
1. Why are CRLs issued periodically even if no certificates are revoked?	
2. How frequent should CRLs be issued?	

3. If a CRL is maintained, why associate an expiration time with certificates?

Delta CRL WILLIAM WHARY	
 Certificates (1) may be huge, and (2) need to be issued periodically 	
 A Delta CRL includes lists changes from the last complete CRL 	
 Delta CRLs may be issued periodically (frequently) and full CRLs are issued less frequently 	
31	
On-line Revocation Servers (OLRS)	
An OLRS is a system that can be queried	
over the network for the revocation status of individual certificates	
An OLRS maintains the full CRL list	
What if someone impersonates an OLRS?	
Solution?	
Good-lists vs. Bad-lists WILLIAM WHARY	
 How about maintaining a list of valid certificates 	
in the CRL instead of the revoked certificates? Is this more secure? Why?	
·	-
 Problems: A good list is likely to be much larger than the bad list (worse performance) 	
2. Organizations might not want to maintain its list of valid certificates public.	
Solution: The good-list can maintain only hashes of the valid certificates
